**Supplementary Figure 2.** Effect of tamoxifen and cisplatin on methyl-β-cyclodextrin (MβCD) induced cytotoxicity in triple negative breast cancer cell lines. MDA-MB 231 and 468 cells were treated with MβCD (0.5 mM) alone and in combination of MβCD (0.5 mM) with tamoxifen (5 µM) or MβCD (0.5 mM) with cisplatin (5 µM) for 48 hours and cytotoxicity was measured with lactate dehydrogenase assay. The cytotoxicity was expressed as percent. The results represent the mean± SD of three independent experiments.
